CampusConnect+ Prototype – ReadMe

Overview

So this project is a front-end prototype of our app called CampusConnect+. We built it using React with JavaScript, and we used Vite as the development tool because it's fast and easy to run locally. The UI is written in JSX (which is basically HTML mixed with JavaScript), and styling is done with simple CSS.

For transparency, we did use AI tools to help with debugging and some issues that we faced with running a host server but everything was reviewed, adjusted, and structured by us. So the full code implementation was written by us and AI was used as an assistant when facing issues.

How to Run the Prototype

To run the project, you'll need Node.js installed on your computer. It works on both Mac and Windows.

Steps:

1. Download or copy the project folder from my github: https://github.com/Ibrahimatatri/CampusConnect-.git
2. Open the folder in VS Code or any code editor
3. Open a terminal inside the project folder
4. Run: npm install
5. Then run: npm run dev
6. Open the link shown in the terminal (usually http://localhost:5173)

That's it, the app should load in your browser.

What You Can Do in the Prototype

This prototype is focused on interaction and design, not full functionality. So you can:

- Log in and go through onboarding
- Browse events on the home screen
- Search and filter events
- View event details
- Join or save events
- Open the map screen (mock navigation)
- Create a new event
- View participants

- Edit profile and settings

Basically, it simulates how a student would discover and join casual events on campus.

What Works and What Doesn't

What works:

- Navigation between all main screens
- Event browsing, clicking, and viewing details
- Basic filtering and search UI
- Creating events (UI flow only)
- Map screen (visual representation)
- Profile and settings screens

What does not fully work:

- No real backend (data is static, not saved permanently)
- Login is not authenticated
- Map is not real GPS navigation
- Notifications and reminders are visual only
- Some buttons simulate behavior but don't store changes

So yeah, it's mainly a front-end prototype for testing usability, not a full system.

Important Notes for Using the Prototype

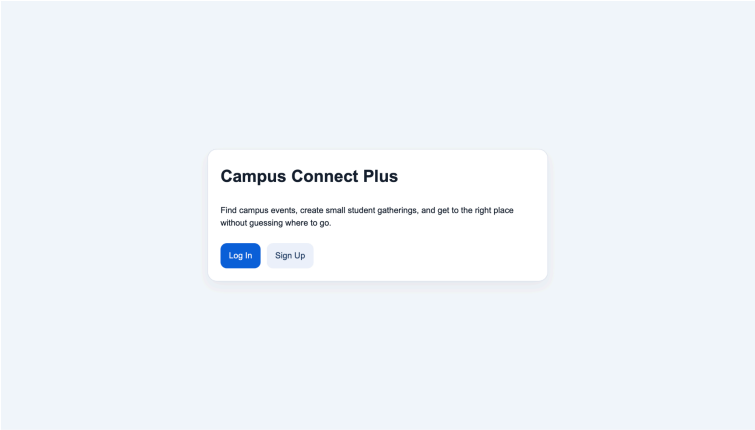
- You can log in with any input (it doesn't check credentials)
- You don't need to sign up, just press login
- When creating events, the data won't persist if you refresh
- Navigation is done through buttons and navbar, not gestures

Tasks for Evaluation and How to Perform Them

Task 1: Log into the app

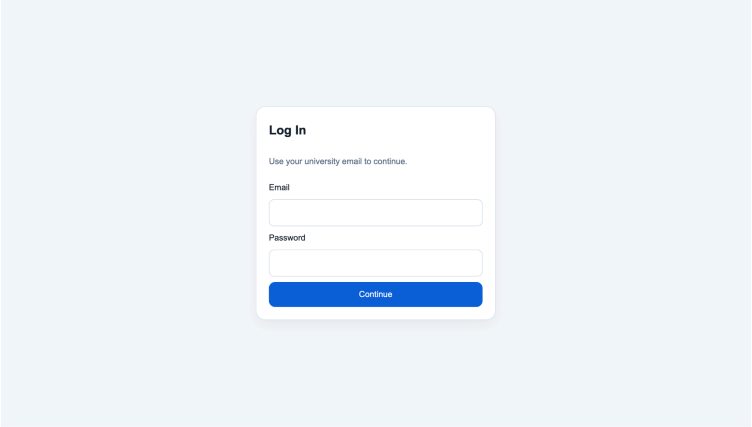
Steps:

Open the app



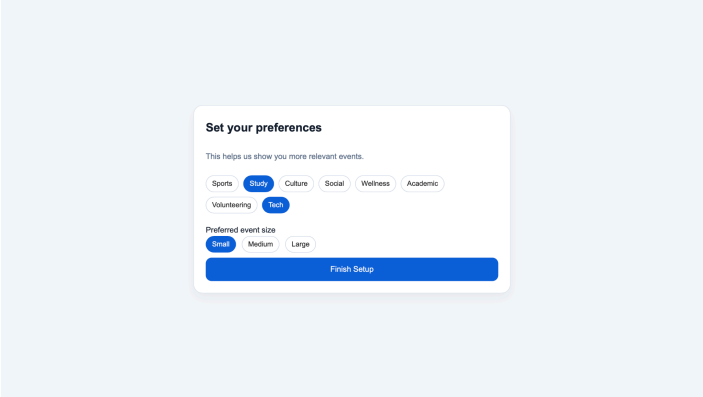
Click on the login button

Enter any username and password



Press login

You should be redirected to onboarding or home



Task 2: Complete onboarding preferences

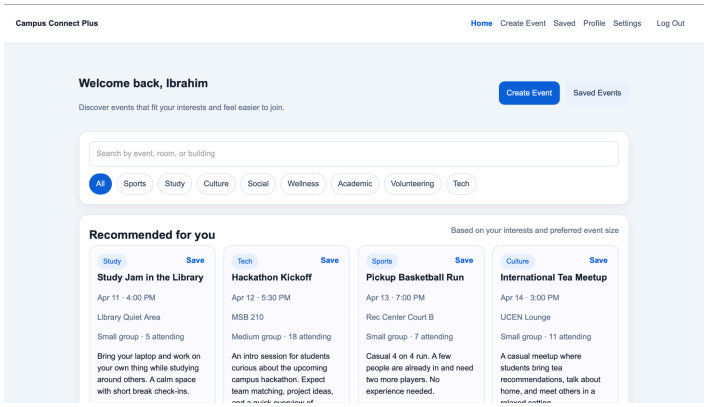
Steps:

Select interests (sports, study, social, etc.)

Choose preferences (small groups, event types)

Click continue

You should reach the home screen



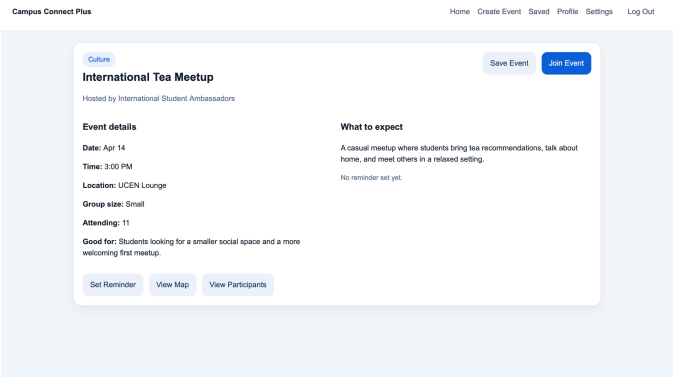
Task 3: Browse events

Steps:

Look at the home page

Scroll through available events

Click on any event card



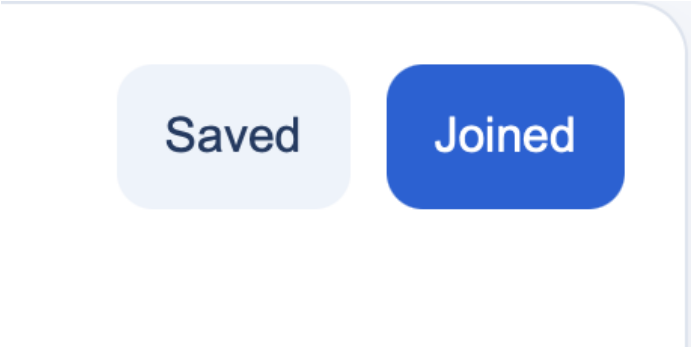
Task 4: View event details

Steps:

Click an event from home

Read description, time, and location

Click join or save

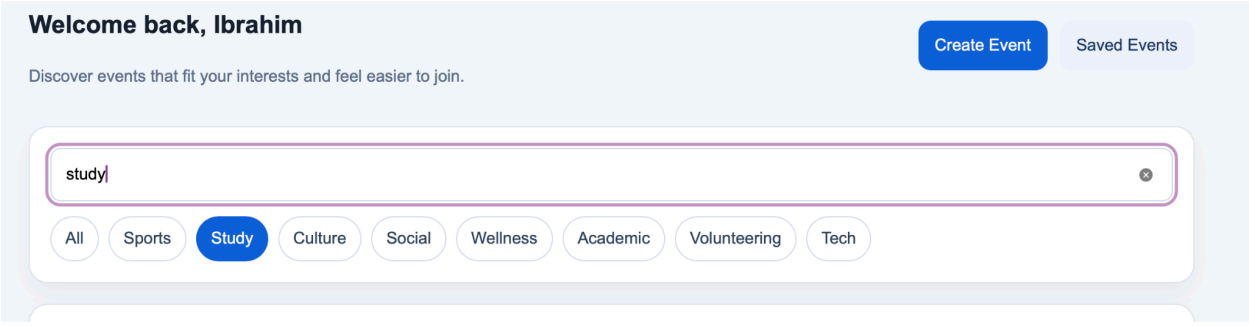


Task 5: Search for an event

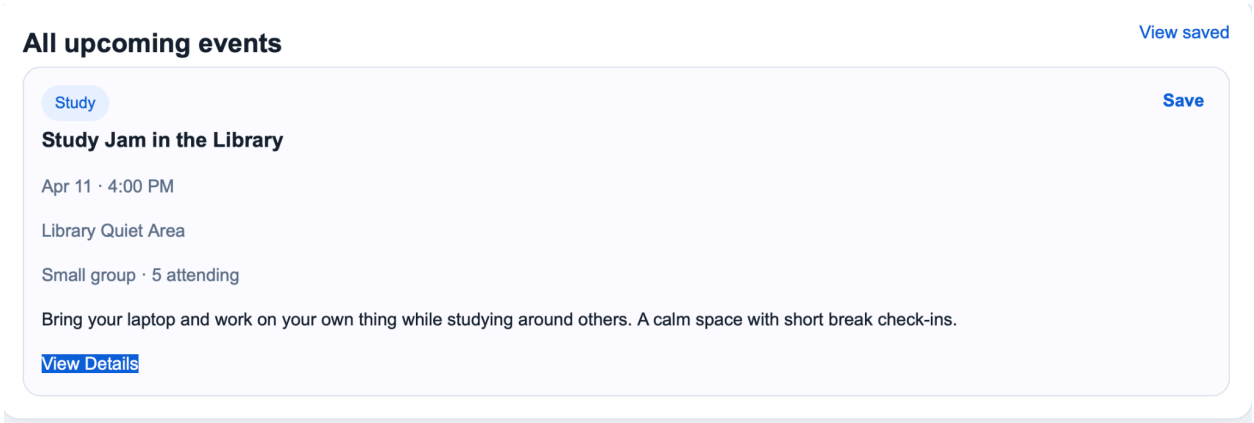
Steps:

Use the search bar on the home screen

Type something like “study” or “basketball”



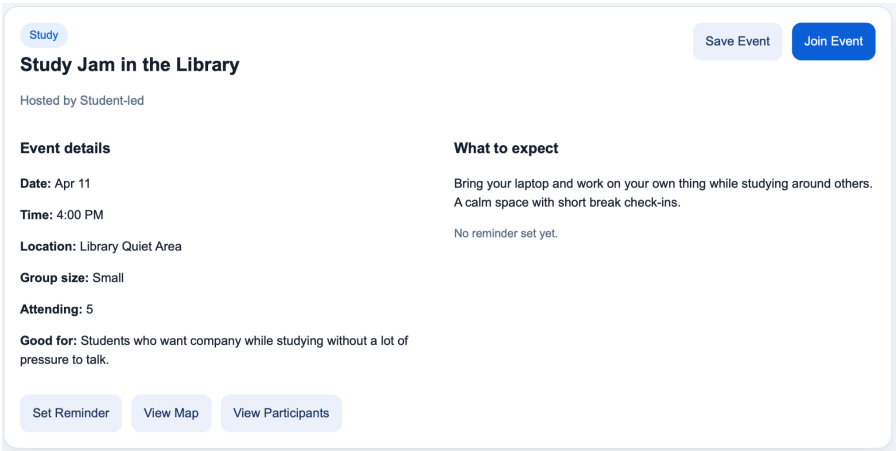
View filtered results



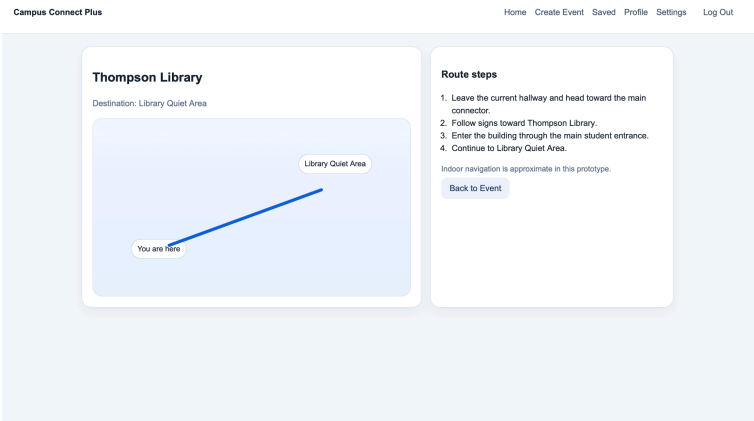
Task 6: Open map navigation

Steps:

Click on an event



Press “View on Map”



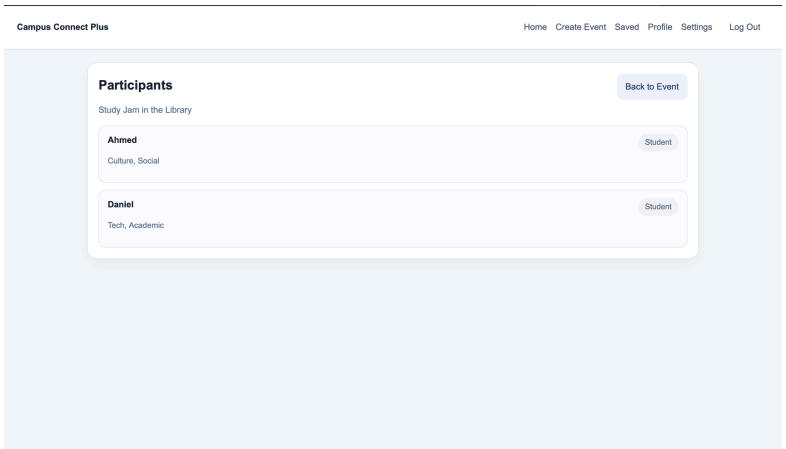
View the navigation screen

Task 7: View participants

Steps:

Go to an event

Click on participants

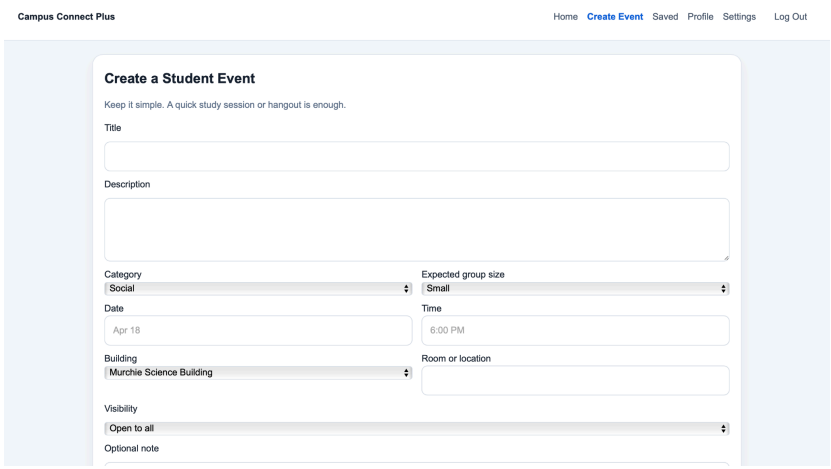


See the list of users

Task 8: Create an event

Steps:

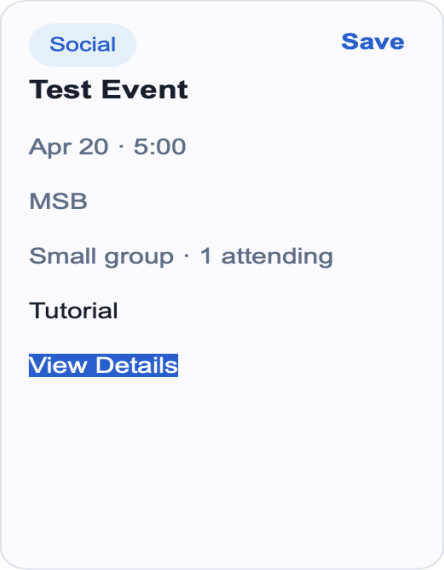
Click the create button in the top right



Fill in event name, location, time

Submit the form

You should return to home



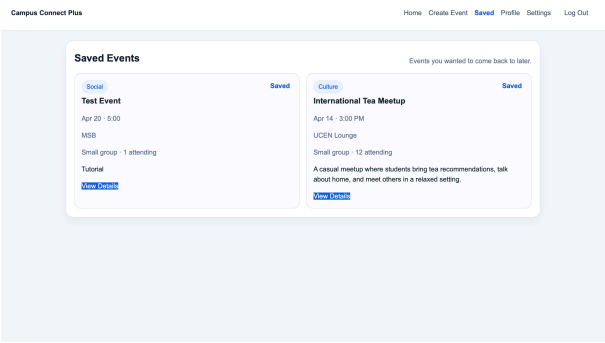
Task 9: Save an event

Steps:

Open any event

Click save/bookmark

Go to saved events page



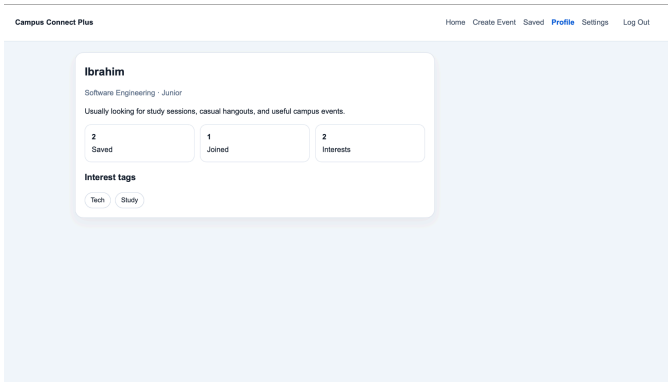
Check if it appears

Task 10: Edit profile

Steps:

Go to profile page

Click edit



Change any field

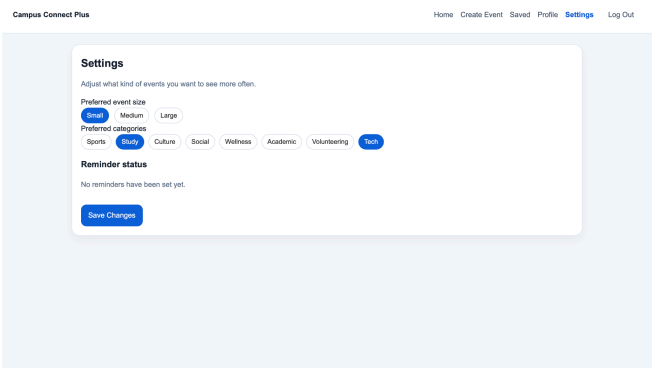
Save changes

Task 11: Change settings

Steps:

Go to settings

Toggle reminder or preferences



Return back

Order of Use

The intended flow is:

Login → Onboarding → Home → Event Interaction → Map / Create Event → Profile / Settings

But users can move freely after reaching the home page.

Final Note

This prototype is mainly for testing usability and interaction flow. It's not meant to be fully functional, but it should give a clear idea of how the system would work in a real website scenario. If something feels incomplete, that's expected at this stage, and it's actually part of what we're evaluating. Also we do know that our working prototype is different from our sketches and final UI design but this is made for a website which was easier to code and make

and was really tightly based on the drawing just in a structure that is accessible for laptop devices. Every functionality and issue discussed in the drawings and prototyping was made just in a slightly different UI and arrangement. Thank you for your understanding.
